**rotacaster™**  
the ultimate in manoeuvrability

## Rotacaster™ multi-directional wheels

The rotacaster™ is the only multi-directional wheel technology developed primarily as an industrial and commercial floor wheel.

The fixed orientation of its main wheel allows forward and reverse movement without fighting a swivel offset, while the peripheral rollers facilitate turning, rotational, lateral and diagonal movement.

### Key benefits include:

- 360° maneuverability without turning or swiveling wheels
- Better directional control & tracking
- Precise positioning - without swivel offset correction
- No resistance due to misaligned swivel casters
- Minimal wheel space/housing requirements
- Simple mounting - choose from rigs, cups, channels and rails or stack together on an axle to form a roller-wheel.
- Load stability – a static center of load relative to wheel base
- Load distribution - the ability to use multiple wheels without swivel offset resistance
- The ability to tilt or lever off the fixed wheel mounting
- Robust - the combined wheel frame and roller axles provide a web like structure with over-molded rollers
- Tough - manufactured from engineering grade polymers
- Rust free - full polymer construction with no steel pins
- Non marking polyurethane rollers

48mm rotacaster - cup mount

48mm rotacaster - rig mount

The rotacaster's unlimited maneuverability makes it a real alternative to a swivel caster and brings a whole new dimension of possibility to the design and functionality of wheeled products.
